1 Plugin category 'compression'

1.1 dc

dynamic compression

1.1.1 Detailed description

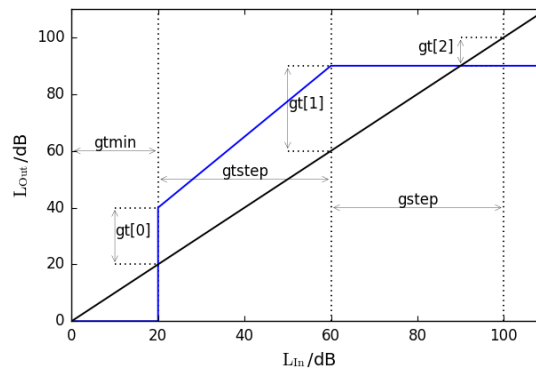

Figure 1 Input-output function of one channel in the dc dynamic compression algorithm.

The plugin *dc* is a multiband dynamic range compression plugin. One compression function (input-output function) is applied to each audio channel. Frequency-dependent compression can be achieved by using the *fftfilterbank* plugin in conjunction with this plugin. The input-level dependent gain function is determined by a gain table containing the gain values applied in different channels and frequency bands. Between the points of the gain table linear interpolation is used. For gains outside of the range of the gaintable a linear extrapolation based on the two nearest points is used. If spectral processing is used, the input level (abscissa of the input-output function, cf. Fig. 1) is determined by an attack- and release-filter of the short time RMS level L_{st} , given in dB (SPL). The attack filter L_a is a first order low pass filter. The release filter L_{in} is a maximum tracker, i.e.

$$L_a = \langle 20 \log_{10}(L_{st}) \rangle_{\tau_{attack}} \quad (1)$$

$$L_{in} = \max(L_a, \langle L_a \rangle_{\tau_{release}}) \quad (2)$$

The gain table is given as a matrix with $n_f \cdot n_{ch}$ rows, where n_f is the number of frequency bands and n_{ch} is the number of channels. The order of row indices is $0 \dots n_f \dots n_f \cdot n_{ch}$. The x-values for the n-th column of the gain table are given as $x_n = gtmin + gtstep \cdot n$. See also Fig. 1. A configuration fragment reproducing Fig. 1 could be:

```

algos = [fftfilterbank dc combinechannels]
fftfilterbank.ftype = center
fftfilterbank.f = [200 2000]
fftfilterbank.ovltype = rect
fftfilterbank.fscale = bark
dc.gtmin=[20 20]
dc.gtstep=[40 40]

```

```
dc.gtdata = [[40 30 -10];[40 30 -10];]
dc.tau_attack = [0.005 0.005]
dc.tau_rmslev = [0.005 0.005]
dc.tau_decay = [0.015 0.015]
dc.combinechannels.name = fftfilterbank_channels
```

In this configuration it is assumed that one audio channel is configured. All variables of *dc* have two entries, one for each frequency band.

1.1.2 Supported domains

The MHA plugin *dc* supports these signal domains:

- waveform to waveform
- spectrum to spectrum

1.1.3 Plugin Tags

compression level-modification

1.1.4 Configuration variables

Name	Type	Description	Default
mhaconfig_in	parser	Input configuration	(see below)
mhaconfig_out	parser	Output configuration	(see below)
powersum	bool	Input level is summed accross channels	no
gtdata	matrix<float>	gaintable data in dB gains	[[[]]]
gtmin	vector<float>	input level for first gain entry in dB SPL	[]
gtstep	vector<float>	level step size in dB	[]
tau_rmslev	vector<float>	RMS level averaging time constant in s	[]
tau_attack	vector<float>	attack time constant in s	[]
tau_decay	vector<float>	decay time constant in s	[]
fb	string	Name of fftfilterbank plugin. Used to extract frequency information.	fftfilterbank
chname	string	name of audio channel number variable (empty: broadband)	
bypass	bool	bypass dynamic compression	no
clientid	string	Client ID of last fit	
gainrule	string	Gain rule of last fit	
preset	string	Preset name of last fit	
modified	int	Flag if configuration has been modified	(monitor)
max_level_difference	matrix<float>	maximum level difference in dB between adjacent bands Range: [0,[[[[]]]
level_in	vector<float>	input level of last block / dB SPL	(monitor)
level_in_filtered	vector<float>	input level after time-constant filters / dB SPL	(monitor)
cf	vector<float>	nominal center frequencies of filterbank bands	(monitor)
ef	vector<float>	edge frequencies of filterbank bands	(monitor)
band_weights	vector<float>	Weights of the individual frequency bands. Computed as (sum of squared fft-bin-weights) / num_frames.	(monitor)
use_wbinhib	bool	Use wideband inhibition?	no
wbinhib	parser		(see below)

Variables of sub-parser mhaconfig_in:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftlen	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

Variables of sub-parser mhaconfig_out:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftlen	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

Variables of sub-parser `wbinhib`:

Name	Type	Description	Default
weights	vector<float>	weighting of neighbour frequencies	[1 2 4 4 4 2 1]
dl_map_min	float	mapping of level/broadband level ratio (in dB) into inhibition ratio, lower value means full inhibition	-8
dl_map_max	float	mapping of level/broadband level ratio (in dB) into inhibition ratio, upper value means no inhibition	2
l_min	float	level threshold, inhibition starts above this level	40
g_scale	matrix<float>	scaling factor of inhibition gain	[[1]]

1.2 dc_simple

Simple dynamic compression scheme

1.2.1 Detailed description

The plugin *dc_simple* is a multiband dynamic compression. One compression function (input-output function) is applied to each audio channel; multiple frequency bands can be used via the *fftfilterbank* plugin. The level dependent gain function is determined by the gains at 50 and 80 dB (G50 and G80). To reduce noise, an expansion is applied below a noise gate level. See also Fig. 2.

If spectral processing is used, the input level (x -axis of the input-output function) is determined by an attack- and release-filter of the short time RMS level L_{st} given in dB (SPL). The attack filter is a first order low pass filter. The release filter is a maximum tracker, i.e.

$$L_a = \langle 20 \log_{10}(L_{st}) \rangle_{\tau_{attack}} \quad (3)$$

$$L_{in} = \max(L_a, \langle L_a \rangle_{\tau_{release}}) \quad (4)$$

The input level is divided into three sections. In each section the input level L_{in} is transformed linearly into a gain G on a log-log scale: $G_{dB} = (m - 1)L_{in} + n$, where m is the slope of the input-output function, and n is an offset. Between expansion threshold and limiter threshold, m and n are given by the gain at 50 and 80 dB. In the section below the expansion threshold, m is the expansion slope, and above the limiter threshold, m is zero. n is chosen to result in a continuous input-output function.

All variables are vectors with one entry for each input channel (number of audio channels times number of frequency bands).

An example configuration of a chain with dynamic compression could be:

Figure 2 Input-output function of one channel in the *dc_simple* dynamic compression algorithm.

```

algos = [fftfilterbank dc_simple combinechannels]
fftfilterbank.ftype = center
fftfilterbank.f = [250 1000 4000]
fftfilterbank.ovltype = rect
fftfilterbank.fscale = bark
dc_simple.g50 = [10 25 40 11 31 55]
dc_simple.g80 = [5 15 10 5 21 19]
dc_simple.expansion_threshold = [20 20 20 20 20 20]
dc_simple.expansion_slope = [4 4 4 4 4 4]
dc_simple.limiter_threshold = [120 120 120 120 120 120]
dc_simple.tau_attack = [0.005 0.005 0.005 0.005 0.005 0.005]
dc_simple.tau_decay = [0.015 0.015 0.015 0.015 0.015 0.015]
combinechannels.name = fftfilterbank_channels

```

In this configuration it is assumed that two audio channels are configured, i.e. all variables of *dc_simple* have three entries for the first audio channel and three for the second audio channel.

1.2.2 Supported domains

The MHA plugin *dc_simple* supports these signal domains:

- waveform to waveform
- spectrum to spectrum

1.2.3 Plugin Tags

compression level-modification

1.2.4 Configuration variables

Name	Type	Description	Default
mhaconfig_in	parser	Input configuration	(see below)
mhaconfig_out	parser	Output configuration	(see below)
g50	vector<float>	Gain in dB at 50 dB input level Range: [-80,80]	[0]
g80	vector<float>	Gain in dB at 80 dB input level Range: [-80,80]	[0]
maxgain	vector<float>	Maximal amplification in dB	[80]
expansion_threshold	vector<float>	expansion threshold in dB	[0]
expansion_slope	vector<float>	expansion slope of input-output function in dB/dB Range: [0,10]	[1]
limiter_threshold	vector<float>	limiter threshold in dB	[100]
tau_attack	vector<float>	attack time constant in s Range: [0,]	[0.005]
tau_decay	vector<float>	decay time constant in s Range: [0,]	[0.05]
bypass	bool	bypass dynamic compression	no
clientid	string	Client ID of last fit	
gainrule	string	Gain rule of last fit	
preset	string	Preset name of last fit	
modified	int	Flag if configuration has been modified	(monitor)
level	vector<float>	Input level in dB	(monitor)
gain	vector<float>	Applied gain in dB	(monitor)
filterbank	string	Name of fftfilterbank plugin. Used to extract frequency information.	
cf	vector<float>	center frequencies of the frequency bands [Hz]	(monitor)
ef	vector<float>	edge frequencies of the frequency bands [Hz]	(monitor)

Variables of sub-parser `mhaconfig_in`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

Variables of sub-parser `mhaconfig_out`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

1.3 softclip

The softclipper implements a broad band dynamic compression above a given level (Compression limiting).

1.3.1 Supported domains

The MHA plugin `softclip` supports these signal domains:

- waveform to waveform

1.3.2 Plugin Tags

compression limiter level-modification

1.3.3 Configuration variables

Name	Type	Description	Default
mhaconfig_in	parser	Input configuration	(see below)
mhaconfig_out	parser	Output configuration	(see below)
tau_decay	float	time constant of decay filter Range: [0,[0.05
tau_attack	float	time constant of attack filter Range: [0,[0.002
start	float	entry point of time domain soft clipping (dB)	110
slope	float	slope of input-output table above start (dB/dB) Range: [0,[0.125

Variables of sub-parser `mhaconfig_in`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftlen	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

Variables of sub-parser `mhaconfig_out`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftlen	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

2 Plugin category 'data-export'

2.1 ac2lsl

Send AC variables as LSL messages.

2.1.1 Detailed description

This plugin provides a mechanism to send ac variables over the network using the lab streaming layer (lsl). If no source id is set, recovery of the stream after changing channel count, data type, or any configuration variable is not possible. Sending data over the network is not real-time safe and processing will be aborted if this plugin is used in a real-time thread without user override. Currently no user-defined types are supported.

2.1.2 Supported domains

The MHA plugin `ac2lsl` supports these signal domains:

- waveform to waveform
- spectrum to spectrum

2.1.3 Plugin Tags

[data-export network-communication lab-streaming-layer](#)

2.1.4 Configuration variables

Name	Type	Description	Default
<code>mhaconfig_in</code>	parser	Input configuration	(see below)
<code>mhaconfig_out</code>	parser	Output configuration	(see below)
<code>vars</code>	vector<string>	List of AC variables to be saved, empty for all.	[]
<code>source_id</code>	string	Unique source id for the stream outlet.	
<code>rt_strict</code>	bool	Abort if used in real-time thread?	yes
<code>activate</code>	bool	Send frames to network?	yes
<code>skip</code>	int	Number of frames to skip after sending Range: [0,]	0

Variables of sub-parser `mhaconfig_in`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftlen	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

Variables of sub-parser `mhaconfig_out`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftlen	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

2.2 ac2osc

Send AC variables as OSC messages over udp.

2.2.1 Detailed description

Send AC variables as OSCvariables using the UDP transport layer. The variable "vars" can be used to select variables from the AC space for sending. The sending of variables can be verified using the open source tool "dump_osc". When selecting an AC variable, a target path can be specified using the colon delimiter, e.g.:

```
vars = [level:/mhalevels]
```

2.2.2 Supported domains

The MHA plugin `ac2osc` supports these signal domains:

- waveform to waveform
- spectrum to spectrum

2.2.3 Plugin Tags

[data-export](#) [network-communication](#) [open-sound-control](#)

2.2.4 Configuration variables

Name	Type	Description	Default
mhaconfig_in	parser	Input configuration	(see below)
mhaconfig_out	parser	Output configuration	(see below)
host	string	OSC server host name	localhost
port	string	OSC server port	7777
tll	int	Time-to-live of UDP packages (1 = subnet)	1
vars	vector<string>	List of AC variables to be saved, empty for all. A colon may be used to specify target address.	[]
mode	keyword_list	record mode Range: [rec pause]	pause
skip	int	number of frames to skip after sending Range: [0,]	0
rt_strict	bool	abort if used in real-time thread?	yes

Variables of sub-parser `mhaconfig_in`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

Variables of sub-parser `mhaconfig_out`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

2.3 acmon

This algorithm converts AC variables into parsable monitor variables.

2.3.1 Supported domains

The MHA plugin `acmon` supports these signal domains:

- waveform to waveform
- spectrum to spectrum

2.3.2 Plugin Tags

data-export network-communication

2.3.3 Configuration variables

Name	Type	Description	Default
mhaconfig_in	parser	Input configuration	(see below)
mhaconfig_out	parser	Output configuration	(see below)
varlist	vector<string>	complete list of variables	(monitor)
dimensions	vector<string>	variable dimensions in AC space	(monitor)
dispmode	keyword_list	display mode of variables Range: [vector matrix]	vector
recmode	keyword_list	record mode Range: [cont snapshot]	cont

Variables of sub-parser `mhaconfig_in`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftlen	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

Variables of sub-parser `mhaconfig_out`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftlen	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

2.4 acsave

Save chain data to text or Matlab 4 files.

Usage:

1. set up file name and type
2. set the maximal length. This will start the recording.
3. Set "flush" to yes to save recorded frames. This will overwrite previously written data.

File name and type can be changed at any time and has to be valid when sending the flush command. Changing the list of variables also starts the recording with the currently configured recording length (previously recorded data might be overwritten). Issuing the 'flush' command frees allocated memory.

2.4.1 Detailed description

The 'acsave' plugin can save numeric algorithm communication variables (AC variables) into files. The files can have plain text, MATLAB 4.x or MATLAB script format. Each signal frame represents a row. The number of columns is gathered at preparation time. If a variable size is increased after preparation, only the part available at preparation time is stored. If the size is decreased, it is zero-padded to the original size.

To save the data to disk, first set up file name and type. Then setting the maximal length will start the recording. At any time, set 'flush' to yes in order to save the recorded frames. This will overwrite previously written data.

File name and type can be changed at any time and have to be valid when sending the flush command.

2.4.2 Supported domains

The MHA plugin `acsave` supports these signal domains:

- waveform to waveform
- spectrum to spectrum

2.4.3 Plugin Tags

[data-export disk-files](#)

2.4.4 Configuration variables

Name	Type	Description	Default
<code>mhaconfig_in</code>	parser	Input configuration	(see below)
<code>mhaconfig_out</code>	parser	Output configuration	(see below)
<code>fileformat</code>	keyword_list	file format of output file Range: [txt mat4 m]	txt
<code>name</code>	string	output file name	
<code>reclen</code>	float	maximal recording length in seconds Range: [0,]	10
<code>flush</code>	bool	flush the buffers to disk	no
<code>vars</code>	vector<string>	list of variables to be saved (empty: save all)	[]

Variables of sub-parser `mhaconfig_in`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftlen	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

3 Plugin category 'data-flow'

3.1 `ac2wave`

Mix the main input signal with a waveform stored into AC variables. Main and AC signal can be attenuated or delayed by integer fragments.

Spectral input is discarded and replaced by a zero signal.

3.1.1 Supported domains

The MHA plugin `ac2wave` supports these signal domains:

- waveform to waveform
- spectrum to waveform

3.1.2 Plugin Tags

data-flow algorithm-communication

3.1.3 Configuration variables

Name	Type	Description	Default
mhaconfig_in	parser	Input configuration	(see below)
mhaconfig_out	parser	Output configuration	(see below)
name	string	AC variable name	
gain_in	float	Linear gain for main input signal	0
gain_ac	float	Linear gain for AC input signal	1
delay_in	int	Delay of main input signal in fragments Range: [0,[0
delay_ac	int	Delay of AC input signal in fragments Range: [0,[0

Variables of sub-parser `mhaconfig_in`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

Variables of sub-parser `mhaconfig_out`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

3.2 acConcat_wave

Concatenating two or more waveforms into one

3.2.1 Detailed description

This plugin concatenates two or more waveforms in the given order into a new waveform all living in the AC space. The waveforms to be concatenated as well as the concatenated waveforms must have the same number of channels. However the lengths of the waveforms to be concatenated may differ.

The waveforms to be concatenated should have been created in advance by some other plugin. This plugin creates an AC variable for the concatenated waveform and puts it into the AC space.

The configuration variable **num_AC** defines the number of waveforms, which will be concatenated into one waveform. The waveforms to be concatenated obey the same naming convention followed by a numeric suffix defining the order of concatenation. This order begins with 1 and a whole in the numeric order is not allowed. This naming convention is defined by the user by setting the configuration variable **prefix_names_AC**. The lengths of each waveform to be concatenated is defined by the configuration variable **samples_AC**. This vector variable must contain an integer value corresponding to each of the waveforms to be concatenated defining their lengths respectively. The name of the concatenated waveform is defined by the configuration variable **name_con_AC**.

This plugin is typically used together with the plugins `doasvm_feature_extraction` instantiated several times for computing the cross correlation between all combinations of input channels and with `doasvm_classification`, which uses the concatenated cross correlation vectors for each channel combination to estimate the arrival direction of audio signals.

As an example, if there are six waveforms, which are supposed to be concatenated into one waveform, this plugin can be configured as shown in the following:

```
acConcat_wave.num_AC = 6
acConcat_wave.samples_AC = [161 17 161 161 17 161]
acConcat_wave.prefix_names_AC = "vGCC"
acConcat_wave.name_con_AC = "vGCCcon"
```

In this case, the six waveforms to be concatenated should be called `vGCC_1`, `vGCC_2`, `vGCC_3`, `vGCC_4`, `vGCC_5` and `vGCC_6`. Note that in the localization context, for a setup of four microphones, there are six different combinations of two microphones.

3.2.2 Supported domains

The MHA plugin `acConcat_wave` supports these signal domains:

- waveform to waveform

3.2.3 Plugin Tags

data-flow algorithm-communication

3.2.4 Configuration variables

Name	Type	Description	Default
mhaconfig_in	parser	Input configuration	(see below)
mhaconfig_out	parser	Output configuration	(see below)

srate	float	Sampling rate in Hz	(monitor)

Variables of sub-parser `mhaconfig_out`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftlen	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

3.3 acPooling_wave

Pooling of several consecutive time frames

3.3.1 Detailed description

This plugin computes an average over several consecutive frames using several different approaches (max, sum, mean, ...). Subsequently, the maximum of the average frame is delivered as well. The plugin receives the frames through the AC space and delivers the averaged frame as well as its maximum to the AC space.

This plugin is typically used together with the plugins `doasvm_feature_extraction` and `doasvm_classification` for estimating the arrival direction of an audio signal. Within this context, this plugin smooths the vector of estimated arrival directions over time using several estimation vectors. However, it can also be used within other contexts for smoothing purposes of e.g. waveforms.

The length of a frame is given by the configuration variable **numsamples**. In the context of localization, for an angular resolution of 5 degrees, a total number of 37 estimation values for the interval of possible arrival directions $[-90, 90]$ would be produced by the `doasvm_classification` plugin.

The frames to be smoothed have to be created by some other plugin in advance, e.g. `doasvm_classification` plugin for the localization, and should be available in the AC space to be read by this plugin. The name of the corresponding AC variable is defined using the configuration variable **p_name**.

At each iteration, this plugin reads the AC variable corresponding to the frame to be smoothed and smooths it by averaging a number of such frames, which have been read in the past iterations and saved in a pool. The length of this pool in msec is defined using the configuration variable **pooling_wndlen**. Depending on the frame rate used within the current MHA configuration, the exact number of iterations, which fall into this pool is computed during the preparation of this plugin. Note that the length of this pool should be chosen carefully so as to make sure that more than one frame falls in.

This plugin implements several pooling methods for smoothing the frames saved in the pool. The alternatives are **max**, **sum** and **mean**. The pooling method to be used is defined using the configuration variable **pooling_type**. For each value in the frame (e.g. for each possible arrival direction in the context of localization), the **max** pooling takes the maximum between the iterations. The **sum** pooling sums these values up. Finally, the **mean** pooling computes the arithmetic mean of these values. Once the pooling step has been completed, a smoothed vector of frames of the same size with a single frame from each iteration has been constructed. This vector is saved in another AC variable, which is defined by using the configuration variable **pool_name**.

Optionally, after the smoothing step, certain areas within the smoothed frame can be weighted differently. In the localization context, this optional step can correspond to a prior probability to favour certain possible arrival directions more compared to others. For instance, a hearing aid wearer can expect that the person who he / she is talking to is in front of him / her. In that case, the prior probabilities for the frontal directions can be set higher than the other possible arrival directions. This can be defined by setting the configuration variable **prob_bias**. The default values of this variable are all set to 1, hence uniform distribution. The size of this variable should be equal to the frame length given in the configuration variable **numsamples**. The smoothed and weighted frame is saved in yet another AC variable, which is defined by using the configuration variable **p_biased_name**.

After the smoothed frame has been computed, the maximum value of this frame is found and saved in another AC variable. In the localization context, this maximum corresponds to the arrival direction of an audio signal. The name of this AC variable is defined using the configuration variable **max_pool_ind_name**.

In the following, an example configuration within a localization context is given. In this configuration, an angular resolution of 5 degrees for the whole circle, namely the interval of $[-180, 180]$ is considered. In that case, there are in total of 73 possible arrival directions.

```
acPooling_wave.p_name = p
acPooling_wave.pool_name = pool
acPooling_wave.max_pool_ind_name = pool_max
acPooling_wave.numsamples = 73
acPooling_wave.pooling_wndlen = 300
acPooling_wave.pooling_type = mean
```

3.3.2 Supported domains

The MHA plugin `acPooling_wave` supports these signal domains:

- waveform to waveform

3.4 combinechannels

Channel combiner

3.4.1 Detailed description

Several filter channels can be combined into one or more output channels by summing the input channels. This plugin is intended as a filter resynthesis of linear-phase filter banks.

The input signal is expected to have a non-interleaved channel order, i.e., first all bands of first output channel, then all bands of second channel, etc.

3.4.2 Supported domains

The MHA plugin `combinechannels` supports these signal domains:

- waveform to waveform
- spectrum to spectrum

3.4.3 Plugin Tags

3.5 db

Synchronous double buffer plugin.

3.5.1 Detailed description

The double buffer plugin allows changes of fragment size. It has an outer layer (e.g. framework) and an inner layer (e.g. MHA kernel, plugin). A configurable fragment size is used on the inner side, which is independent from the outer fragment size. The input data is buffered, and the data is processed when enough samples are available.

Please note that double buffering adds an extra delay of the audio stream. If both fragment sizes are identical, the double buffering is bypassed.

Figure 3 Concept of the double buffer plugin. The outer fragments, provided by the framework, are split up into smaller fragments for processing in the kernel. For a continuous output stream, an extra delay is needed, i.e. the first fragment is filled with zeros at the beginning.

3.5.1.1 Warning:

If the inner fragment size is larger than the outer fragment size, the maximal processing time is limited by the shorter fragment size. This results in a maximal processor usage determined by the ratio of outer to inner fragment size. This problem holds not for offline processing. As an alternative, the asynchronous double-buffer plugin `dbasync` (section ??) can be used, which processes the double-buffered signal in a separate thread. That plugin should be preferred for real-time processing. If the inner thread should only be used for signal analysis, please refer to the plugin `analysispath` (section 13.2).

3.5.2 Supported domains

The MHA plugin `db` supports these signal domains:

- waveform to waveform

3.9 matrixmixer

Matrix mixer plugin, can mix multiple input channels into any number of output channels with configurable weights.

3.9.1 Detailed description

The `matrixmixer` plugin can combine the signal from multiple input channels into any number of output channels, with defined mixing weights.

Example: To combine the two channels of a stereo signal into a single (mono) channel, configure the `matrixmixer` plugin configuration variable `m` as

```
m = [[1.0 1.0]]
```

which causes the first and the second channel to be multiplied with a weight of 1 before they are mixed (by adding them together) to form a single output channel.

It is also possible to mix the channels with weights different from 1:

```
m = [[1 0.5]]
```

This attenuates the second channel by multiplying all samples in that channel with 0.5 before mixing it with the first channel. The configuration variable `m` expects a matrix of float values. The examples above showed a matrix with only one row, which resulted in only one output channel being produced by the `matrixmixer` plugin. To produce more output channels, more rows (separated by semicolons)¹ can be specified for matrix `m`:

¹In openMHA configuration, a matrix is specified as a vector of vectors, where the subsequent row vectors are separated by semicolons. For details, refer to the subsection on multidimensional variables in the openMHA application manual.

```
m = [[1 0]; [0 1]]
```

This is the identity matrix for two channels. This matrix does not change the signal.

The following setting demonstrates how `matrixmixer` can be used to change the order of audio channels in a multi-channel signal. This example swaps the first two channels:

```
m = [[0 1]; [1 0]]
```

The next setting creates a 4-channel signal output from a stereo signal, where the first two channels are the original stereo channels, the third is the sum of the two stereo channels, and the fourth output channel is the difference of the two stereo channels²:

```
m = [[0 1]; [1 0]; [1 1]; [1 -1]]
```

The following example duplicates a single input channel to two output channels:

```
m = [[1]; [1]]
```

To summarize, you need to configure the variable `m` with a matrix with float values. The matrix needs to have as many columns as the `matrixmixer` receives input channels, and as many rows as you want `matrixmixer` to produce output channels.

Example configurations and example input files are contained in the `matrixmixer` examples directory. Please refer to the README file in this directory for an explanation of the different examples.

A matlab/octave test exercising the `matrixmixer` plugin in six different configurations can be found in the `mhatest` directory in file `test_matrixmixer.m`. This test file is executed together with the other system-level tests when invoking `make test`.

3.9.2 Supported domains

The MHA plugin `matrixmixer` supports these signal domains:

- waveform to waveform
- spectrum to spectrum

3.9.3 Plugin Tags

data-flow audio-channels

²The combination of the sum and the difference of the two channels of a stereo signal is known as the mid-side signal and used for stereo transmission in FM radio. We combine it here with the original stereo signal for the sole purpose of demonstrating the creation of more output channels than input channels with the `matrixmixer` plugin.

3.9.4 Configuration variables

Name	Type	Description	Default
mhaconfig_in	parser	Input configuration	(see below)
mhaconfig_out	parser	Output configuration	(see below)
m	matrix<float>	Mixer matrix, one row vector for each output channel. The number of columns must match the number of input channels.	[[1 0];[0 1]]

Variables of sub-parser `mhaconfig_in`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

Variables of sub-parser `mhaconfig_out`:

Name	Type	Description	Default

fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

3.10 route

Signal router plugin.

Arguments are the input signal source names (AC variables) followed by a colon, followed by the channel number, starting at zero. Empty names correspond to the direct input.

An AC variable will be created if the AC output dimension is not zero. Example: `out = [:0 :1 x:0 x:1] ac = [:2 :3]` returns a four channel output signal containing first two direct input channels, and the first two channels of the AC variable "x". An AC variable is created with the third and fourth channel of the direct input.

3.10.1 Supported domains

The MHA plugin `route` supports these signal domains:

- waveform to waveform
- spectrum to spectrum

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

3.12 save_wave

Save signal waveform to AC variable

3.12.1 Supported domains

The MHA plugin `save_wave` supports these signal domains:

- waveform to waveform

3.12.2 Plugin Tags

[data-flow](#) algorithm-communication

3.12.3 Configuration variables

Name	Type	Description	Default
mhaconfig_in	parser	Input configuration	(see below)
mhaconfig_out	parser	Output configuration	(see below)

Variables of sub-parser `mhaconfig_in`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftlen	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

Variables of sub-parser `mhaconfig_out`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftlen	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

3.13 shadowfilter_begin

Save signal spectrum to AC variable

3.13.1 Detailed description

The plugins 'shadowfilter_begin' and 'shadowfilter_end' (section 3.14) are designed to measure the gains produced by any spectral plugins and apply those gains to audio channels not passed to the algorithm. This method can be used to process a mixed signal, but apply the same gains to the unmixed signal parts separately. For a stereo mixed signal, this can be done by reading the mixed signal from channels 1 and 2, the desired signal from channels 3 and 4, and the competing signal from channels 5 and 6. The 'shadowfilter_begin' plugin hides channels 3 to 6 from the plugin, and remembers the input spectrae for all channels. The 'shadowfilter_end' plugin compares the processed output signal (channels 1 and 2) with its input spectrum and derives complex gains produced by the algorithm (without any knowledge of the algorithm). The same gains are applied to channels 3 to 6.

3.13.2 Supported domains

The MHA plugin `shadowfilter_begin` supports these signal domains:

- spectrum to spectrum

3.13.3 Plugin Tags

data-flow feature-extraction filter

3.13.4 Configuration variables

Name	Type	Description	Default
mhaconfig_in	parser	Input configuration	(see below)
mhaconfig_out	parser	Output configuration	(see below)
nch	int	number of processing channels Range: [1,[1
ntracks	int	number of input sources, each with nch audio channels Range: [1,[1

Variables of sub-parser `mhaconfig_in`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

Variables of sub-parser `mhaconfig_out`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

3.14 shadowfilter_end

Compute spectral gains seen since `shadowfilter_begin`, apply gains to other tracks

3.14.1 Detailed description

See section 3.13 for a description of the shadow filter method. The 'shadowfilter_end' plugin creates an AC variable `shadowfilter_gains`, which contains the complex gains created by the algorithm.

3.14.2 Supported domains

The MHA plugin `shadowfilter_end` supports these signal domains:

- spectrum to spectrum

3.14.3 Plugin Tags

data-flow feature-extraction filter

3.14.4 Configuration variables

Name	Type	Description	Default
mhaconfig_in	parser	Input configuration	(see below)
mhaconfig_out	parser	Output configuration	(see below)
basename	string	configuration name of shadowfilter_begin	shadowfilter_begin

Variables of sub-parser `mhaconfig_in`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftlen	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

Variables of sub-parser `mhaconfig_out`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftlen	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

4 Plugin category 'data-import'

4.1 acSteer

Steering Vector Loading Plugin

4.1.1 Detailed description

The `acSteer` plugin loads a file containing pre-computed steering filters (e.g. MVDR filters) to be used within a beamformer. The steering filters can be monaural (**nrefmic = 1**) or binaural (**nrefmic = 2**). The whole file consists of a column vector of concatenated steering vectors, which are formatted in the order of **angle** and **channel**. This means that the first channel vector of the first angle is followed by the second channel vector of the first angle until the last channel. The channel vectors of the first angle are followed by the channel vectors of the second angle and so on and so forth.

If the steering filters have been computed for two reference microphones, the steering filters of the second reference microphone just follow the ones for the first microphone and have the same format.

This plugin is typically located between a localization plugin (e.g. `doasvm_classification`) and a beamforming plugin (e.g. `steerbf`). The localization plugin estimates the source direction and saves it in an AC variable. This plugin reads the saved direction from the corresponding AC variable and saves the corresponding steering vector to the AC space, which is used by the succeeding beamforming plugin for steering the beam towards that particular direction.

The configuration variable **nrefmic** indicates the number of different reference microphone settings, for which the filters were computed. For each reference microphone and each possible DOA angle and each input channel one filter should be provided so that

$$n_{steerchan} = n_{refmic} * n_{chan} * n_{angle} \quad (5)$$

4.1.2 Supported domains

The MHA plugin `acSteer` supports these signal domains:

- spectrum to spectrum

4.1.3 Plugin Tags

data-import disk-files beamformer binaural adaptive

4.1.4 Configuration variables

Name	Type	Description	Default
mhaconfig_in	parser	Input configuration	(see below)
mhaconfig_out	parser	Output configuration	(see below)
steerFile	string	Name of the input file where the steering vectors are saved	steerfile.bin
acSteerName1	string	Name of the AC variable where the steering vectors of the first (left) reference microphone are saved	acSteerLeft
acSteerName2	string	Name of the AC variable where the steering vectors of the second (right) reference microphone are saved	acSteerRight
nsteerchan	int	Number of channels in each steering vector	4
nrefmic	int	Number of reference microphones Range:]0,2]	1

Variables of sub-parser `mhaconfig_in`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftlen	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

Variables of sub-parser `mhaconfig_out`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftlen	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

4.2 addsndfile

Add data from a sound file to some channels of input signal.

The sound file is read into memory and scaled to a given peak level, i.e. the RMS level of an abstract signal with 0 dB full scale. Changing any parameter will start playing the file from the beginning. Playback of the file starts only after the complete file has been read. If the sound file has fewer channels than the 'channels' vector has elements, then the file channels will be repeated.

4.2.1 Detailed description

Add data from a sound file to some channels of input signal.

The sound file is read into memory and scaled to a given peak level, i.e. the RMS level of an abstract signal with 0 dB full scale. Changing any parameter will start playing the file from the beginning. Playback of the file starts only after the complete file has been read. If the sound file has fewer channels than the 'channels' vector has elements, then the file channels will be repeated. The addsndfile plugin does not change the number of MHA audio channels. If you specify a channel index \geq the number of MHA audio channels, then the channel from the sound file will not be used.

4.2.2 Supported domains

The MHA plugin `addsndfile` supports these signal domains:

- waveform to waveform

4.2.3 Plugin Tags

data-import disk-files signal-generator

4.2.4 Configuration variables

Name	Type	Description	Default
mhaconfig_in	parser	Input configuration	(see below)
mhaconfig_out	parser	Output configuration	(see below)
path	string	Optional path to sound file	
filename	string	File name of the sound file.	
loop	bool	Infinitely loop the playback of the sound file	yes
level	float	Level in dB (SPL) of the input file	0
levelmode	keyword_list	Level mode Range: [relative peak rms rms_limit40]	relative
resamplingmode	keyword_list	Resampling mode Range: [dont_resample_permissive dont_resample_strict do_resample]	do_resample
channels	vector<int>	Output signal channels in which to store the individual sound file channels. Output channel indices start from 0. Note: The addsndfile plugin does not change the number of MHA audio channels. If you specify a channel index \geq the number of MHA audio channels, then that channel from the sound file will not be used. Range: [0,]	[0]
mode	keyword_list	Playback mode Range: [add replace input mute]	add
ramplen	float	Length of hanning ramp at level changes in seconds Range: [0,]	0
startpos	int	Starting position in samples, loop will begin from zero Range: [0,]	0
mapping	vector<int>	Channel mapping	(monitor)
filechannels	int	Number of channels in current file	(monitor)
mhachannels	int	Number of MHA channels at plugin position	(monitor)
active	int	indicates whether sound is currently played back	(monitor)
search_pattern	string	Search pattern for file list	*.wav
files	vector<string>	Available files	(monitor)

Variables of sub-parser mhaconfig_in:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftlen	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

Variables of sub-parser mhaconfig_out:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftlen	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

5 Plugin category 'example'

5.1 example1

5.1.1 Detailed description

The **simplest** example of an openMHA plugin.

This plugin scales one channel of the input signal, working in the time domain.

5.1.2 Supported domains

The MHA plugin `example1` supports these signal domains:

- waveform to waveform

5.1.3 Plugin Tags

example level-modification audio-channels

5.1.4 Configuration variables

Name	Type	Description	Default
mhaconfig_in	parser	Input configuration	(see below)
mhaconfig_out	parser	Output configuration	(see below)

Variables of sub-parser `mhaconfig_in`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftlen	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

Variables of sub-parser `mhaconfig_out`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

5.2 example2

This plugin multiplies the sound signal in one audio channel by a factor

5.2.1 Supported domains

The MHA plugin `example2` supports these signal domains:

- waveform to waveform

5.2.2 Plugin Tags

[example level-modification audio-channels](#)

5.2.3 Configuration variables

Name	Type	Description	Default
mhaconfig_in	parser	Input configuration	(see below)
mhaconfig_out	parser	Output configuration	(see below)
channel	int	Index of audio channel to scale. Indices start from 0. Range: [0,[0
factor	float	The scaling factor that is applied to the selected channel. Range: [0,[0.1

Variables of sub-parser `mhaconfig_in`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

Variables of sub-parser `mhaconfig_out`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

5.3 example3

This plugin multiplies the sound signal in one audio channel by a factor

5.3.1 Supported domains

The MHA plugin `example3` supports these signal domains:

- waveform to waveform

5.3.2 Plugin Tags

example level-modification audio-channels

5.3.3 Configuration variables

Name	Type	Description	Default
mhaconfig_in	parser	Input configuration	(see below)
mhaconfig_out	parser	Output configuration	(see below)
channel	int	Index of audio channel to scale. Indices start from 0. Only channels with even indices may be scaled. Range: [0,[0
factor	float	The scaling factor that is applied to the selected channel. Range: [0,[0.1
prepared	int	State of this plugin: 0 = unprepared, 1 = prepared	(monitor)

Variables of sub-parser `mhaconfig_in`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

Variables of sub-parser `mhaconfig_out`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

5.4 example4

This plugin multiplies the sound signal in one audio channel by a factor. It works in the spectral domain.

5.4.1 Supported domains

The MHA plugin `example4` supports these signal domains:

- spectrum to spectrum

5.4.2 Plugin Tags

example level-modification audio-channels

5.4.3 Configuration variables

Name	Type	Description	Default
mhaconfig_in	parser	Input configuration	(see below)

srate	float	Sampling rate in Hz	(monitor)

6 Plugin category 'feedback-suppression'

6.1 fshift

6.1.1 Detailed description

Performs a quantized frequency shift on the selected frequency interval. The frequency band between (originally) `fmin` and `fmax` (frequencies in Hz) is shifted by `df` (desired frequency change in Hz). Positive `df` shifts the selected band to higher frequencies, negative `df` shifts to lower frequencies.

The shifted and the unshifted parts of the input signal are split at the STFT bin boundaries nearest to the. The frequency shift `df` is rounded to the nearest bin as well. The parts of the spectrum that would be shifted below 0 Hz or above the Nyquist frequency are discarded.

6.1.2 Supported domains

The MHA plugin `fshift` supports these signal domains:

- spectrum to spectrum

6.1.3 Plugin Tags

feedback-suppression frequency-modification

6.1.4 Configuration variables

Name	Type	Description	Default
mhaconfig_in	parser	Input configuration	(see below)
mhaconfig_out	parser	Output configuration	(see below)
fmin	float	lower boundary for frequency shifter in Hz Range: [0,]	4000
fmax	float	upper boundary for frequency shifter in Hz Range: [0,]	16000
df	float	shift frequency in Hz	40

Variables of sub-parser `mhaconfig_in`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

Variables of sub-parser `mhaconfig_out`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

6.2 fshift_hilbert

Pitch shifter

6.2.1 Detailed description

Performs a frequency shift on the selected frequency interval. The frequency band between (originally) `fmin` and `fmax` (frequencies in Hz) is shifted by `df` (desired frequency change in Hz). Positive `df` shifts the selected band to higher frequencies, negative `df` shifts to lower frequencies.

The frequency shift on the sub-band is performed by splitting the input signal's spectrum into 2 parts: the band to be shifted, and the rest. The band to be shifted is multiplied in the time domain with a complex sinusoid of frequency `df` Hz (see Wardle(1998)³) before it is recombined in the spectral domain with the unshifted signal part.

By default the shifted and the unshifted parts of the input signal are split at STFT bin boundaries. The resulting rectangular transitions between shifted and unshifted parts can be smoothed if desired by setting `phasemode` to `linear` or `minimal`, and choosing a longer impulse response length than the default of 1 sample. Our experience with hearing aid applications so far suggests that smoothing these boundaries is not necessary.

6.2.2 Supported domains

The MHA plugin `fshift_hilbert` supports these signal domains:

- spectrum to spectrum

6.2.3 Plugin Tags

feedback-suppression *frequency-modification*

6.2.4 Configuration variables

Name	Type	Description	Default
<code>mhaconfig_in</code>	parser	Input configuration	(see below)

6.3 lpc

This plugin implements the linear predictive coding analysis (LPC) by using the Levinson-Durbin recursion.

6.3.1 Detailed description

This plugin estimates the autocorrelation of each block. It then produces the inverse filter using the Levinson-Durbin recursion.

6.3.2 Supported domains

The MHA plugin `lpc` supports these signal domains:

- waveform to waveform

6.3.3 Plugin Tags

feedback-suppression adaptive

6.3.4 Configuration variables

Name	Type	Description	Default
mhaconfig_in	parser	Input configuration	(see below)
mhaconfig_out	parser	Output configuration	(see below)
lpc_order	int	LPC filter order Range: [0,500]	20
lpc_buffer_size	int	Size of the buffer in samples for which the autocorrelation matrix will be computed Range: [0,501]	21
shift	bool	Refill the LPC buffer completely with new input signal by ignoring the old samples (no) or shift the old buffer as large as the block size of the input signal and read in the current input signal (yes).	yes
comp_each_iter	int	Reestimate the LPC coefficients each <comp_each_iter> iterations, default value is 1 Range: [0,]	1
norm	bool	Normalize the auto correlation matrix with the LPC order	no

Variables of sub-parser `mhaconfig_in`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

Variables of sub-parser `mhaconfig_out`:

Name	Type	Description	Default

fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

6.4 lpc_bl_predictor

This plugin performs forward and backward linear prediction using the Burg - Lattice algorithm for computing the next value of a given time series.

The estimated forward and backward linear prediction parameters are saved in the AC space.

6.4.1 Detailed description

This plugin computes the forward and backward LPC estimates using the Burg-Lattice algorithm given the κ (sometimes also called μ) parameter precomputed using the `lpc_burg-lattice` plugin. The estimation of the forward and backward linear prediction parameters is performed using the following equations: For each forward and backward linear prediction parameter $f(m)$ and $b(m)$, where m in $[2 \cdots P]$, P being the lpc order

$$f(m) = f(m-1) + \kappa(m, 2) * b(m-1, 2) \quad (6)$$

$$b(m, 1) = b(m-1, 2) + \kappa(m, 2) * f(m-1) \quad (7)$$

. In this implementation κ from the previous is used. Note that the second index of κ is 2.

6.4.2 Supported domains

The MHA plugin `lpc_bl_predictor` supports these signal domains:

- waveform to waveform

6.4.3 Plugin Tags

feedback-suppression adaptive

6.5 lpc_burg-lattice

This plugin estimates the linear predictive coding coefficients for estimating the next sample value of a time series using the Burg-Lattice approach.

The estimated parameters are saved in the AC space.

6.5.1 Detailed description

This plugin estimates the parameters for the forward and backward linear prediction using the Burg - Lattice algorithm. The previous estimate of the κ parameter is saved in the AC space for future use in the `lpc_bl_predictor` plugin to estimate several time-series sharing the same κ values.

For the estimation of κ the following series of equations are used: For each κ in $[2 \dots P]$, P being the lpc order

$$dm(m-1) = \lambda * dm(m-1) + (1 - \lambda) * (f(m-1)^2 + b(m-1, 2)^2) \quad (8)$$

$$nm(m-1) = \lambda * nm(m-1) + (1 - \lambda) * -2 * f(m-1) * b(m-1, 2) \quad (9)$$

$$km(m, 1) = \frac{nm(m-1)}{dm(m-1)}. \quad (10)$$

Note that the previous estimate of κ , which is given by $\kappa(m, 2)$ is saved in the AC space.

6.5.2 Supported domains

The MHA plugin `lpc_burg-lattice` supports these signal domains:

- waveform to waveform

6.6 nlms_wave

This plugin adaptively estimates the coefficients of a filter by means of the NLMS algorithm.

The estimated filter is stored into an AC variable named by the algorithm configuration name or by the configuration variable `name_f` and the input signal is filtered by the current filter and returned as the output signal of the plugin.

6.6.1 Detailed description

This plugin implements the NLMS algorithm for re-estimating the coefficients of an adaptive filter in each iteration. The estimated filter coefficients are saved in an AC variable having the same name as the plugin in the current configuration. The name of this AC variable can also be set differently by setting the configuration variable **name_f**. The input signal is filtered by the filter estimated in the current iteration and returned as the current output of the plugin from within the processing callback. The estimation of the filter coefficients is performed using the update rule given as in the following:

$$e[k] = y[k - 1] - f[k - 1]u[k - 1] \quad (11)$$

$$f[k] = f[k - 1] + \rho / (|u|^2 + c) u[k - 1] e[k], \quad (12)$$

where e is the error signal, y is the desired signal and u is the input signal. All three signals are read from the AC space. For this, the configuration variables **name_e**, **name_d** and **name_u** should be set. The error signal can also be computed within the plugin given the other two signals, when the corresponding configuration variable is left empty. The plugin can be configured to use also the current sample $u[k]$ of the input signal in the estimation by assigning the configuration variable **estimtype** to the value *current*. However in the default case (*previous*), the previous values as long as the filter (**ntaps**) but the current one are used.

6.6.2 Supported domains

The MHA plugin `nlms_wave` supports these signal domains:

- waveform to waveform

7 Plugin category 'filter'

7.1 iirfilter

IIR filter

7.1.1 Detailed description

The 'iirfilter' plugin implements a generic IIR filter (direct form II). The coefficients have the same names as in MATLAB. Due to different internal implementations and numeric resolutions, filters may be instable with coefficients which are stable in MATLAB.

7.1.2 Supported domains

The MHA plugin `iirfilter` supports these signal domains:

- waveform to waveform

7.1.3 Plugin Tags

filter

7.1.4 Configuration variables

Name	Type	Description	Default
A	vector<float>	recursive filter coefficients	[1]
B	vector<float>	non-recursive filter coefficients	[1]

7.2 steerbf

Steerable Beamformer

7.2.1 Detailed description

Implements frequency-domain beamformer processing (filter and sum) using externally provided filters. A plugin called `acSteer` can be used to provide the filter coefficients. The filter coefficients to be read are saved as a waveform object in the AC space. Each channel of this object corresponds to a different steering angle. The steering angle is typically determined in real-time by a localization plugin (e.g. `doasvm_classification`). In this case, the index to the corresponding steering direction is read from the AC space. Note that the number of available filters should be consistent with the number of possible steering directions to be estimated. The configuration variable **angle_src** keeps the name of the AC variable for the estimated steering direction. The steering angle can also be fixed in the configuration time using the configuration variable **angle_ind**.

7.2.2 Supported domains

The MHA plugin `steerbf` supports these signal domains:

- spectrum to spectrum

7.2.3 Plugin Tags

filter spatial audio-channels beamformer binaural

7.2.4 Configuration variables

Name	Type	Description	Default
mhaconfig_in	parser	Input configuration	(see below)
mhaconfig_out	parser	Output configuration	(see below)
bf_src	string	Provides the beamforming filters encoded as a block matrix: [chanXnangle,nfreq].	
angle_ind	int	Sets the steering angle in filtering. Range: [0,1000]	0
angle_src	string	If initialized, provides an int-AC variable of steering index.	

Variables of sub-parser `mhaconfig_in`:

Name	Type	Description	Default

domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

7.3 transducers

Signal level calibration plugin.

7.3.1 Detailed description

Some plugins in the MHA expect the input signal to be calibrated to sound pressure level in Pascal. This plugin converts AD and DA converter levels to SPL in Pa and also allows for a FIR filters for microphone and receiver equalization.

A schematic calibration rule for the MHA

1. Measure frequency response of hearing aid microphones and receiver.
2. Create FIR filter coefficients for frequency response equalization for microphones and receiver, configure the FIR coefficients of this plugin correspondingly.
3. Play an acoustic reference signal of a known SPL level to the microphone, adjust the 'calib_in.peaklevel' variable until the internal level meter (e.g. rmslevel, p. 72) shows the same level.
4. Create a test tone in the MHA (e.g. with 'noise', p. 90, or 'sine', p. 93) of a given level, and adjust the variable 'calib_out.peaklevel' until the same acoustic level is measured at the receiver.

Besides the signal calibration, this plugin also contains a soft-limiter in the output path, and a quantization module. The soft-limiter acts as a fast broadband compressor, and can be configured correspondingly. The quantisation module limits the signal to the interval $[-1, 1]$ and optionally reduces the resolution, by this quantization rule:

$$y = \text{floor}(2^{(N-1)}x)2^{-(N-1)} \quad (13)$$

N is the number of bits, x the input signal and y the output signal.

7.3.2 Supported domains

The MHA plugin `transducers` supports these signal domains:

- waveform to waveform

8 Plugin category 'filterbank'

8.1 `fftfbpow`

FFT based filterbank analysis with overlapping filters

8.1.1 Detailed description

This plugin implements a filterbank based on FFT spectrum. The power in each filter bank channel is calculated and stored into an AC variable. The input signal is passed through unmodified.

For details on the filter shapes, please see description of plugin `fftfilterbank` (section 8.2 on page 64).

8.1.2 Supported domains

The MHA plugin `fftfbpow` supports these signal domains:

- spectrum to spectrum

8.2 fftfilterbank

FFT based filterbank with overlapping filters

8.2.1 Detailed description

This plugin implements a linear phase filterbank based on FFT spectrum. Each filter bank channel is stored into an own audio channel. The number of output channels of this plugin is the number of frequency bands times the number of input channels.

Please use the iFFT plugin *spec2wave* (p. 96) to get the waveform signal of the filterbank output. The *matrixmixer* (p. 27) plugin or *combinechannels* (p. 21) can be used for resynthesis.

The filters are calculated by applying filter weights to each FFT bin. These weights (filter shapes) depend on the settings of the `ftype` variable. If `center` is selected, the frequency interval between the lower neighbour center frequency and the desired center frequency is mapped to the interval $[-1,0]$ and between the desired center frequency and the upper neighbour to the interval $[0,1]$. These mappings are linear on the given frequency scale so that a value of 0.5 denotes the middle between two neighbored center frequencies on the given frequency scale. The filter weights are calculated with the configured crossing function on this interval, see next figure for details. Please note that the filters are not necessarily symmetric (symmetry is achieved only if the center frequencies are equally spaced on the desired frequency scale). The lowest and highest filter channels include the full range from zero to the center frequency or from the center frequency to the nyquist frequency, respectively.

If `edge` is selected, then the frequency axis is transformed to be linear on the desired frequency scale. The interval between two edge frequencies is mapped to $[-0.5,0.5]$. Now, the filter shape function (rectangular, linear/sawtooth, hanning) is applied to the frequency axis. This results in symmetric filters on the desired frequency scale.

Figure 4 Schematic plot of overlapping filters

Figure 5 Example filter shapes with center frequencies configured

8.2.2 Supported domains

The MHA plugin `fftfilterbank` supports these signal domains:

8.3 gtfb_analyzer

Gammatone Filterbank Analyzer

8.3.1 Detailed description

Implements a complex-valued gammatone filterbank using cascaded first-order filters as described in Hohmann(2002)⁴, and Herzke and Hohmann(2007)⁵. Set the parameter order to the desired gammatone filter order. The coeff is a vector of complex filter coefficients, one for each filterbank frequency band. The complex coefficients need to be computed outside of the MHA, e.g. with the help of the matlab implementation of the gammatone filterbank which can be downloaded from <https://uol.de/mediphsik/downloads/>. Similarly, the combination of normalization factors and phases also have to be computed outside of the MHA, e.g. also with the same matlab implementation of this gammatone filterbank.

The output signal produced by this plugin contains the complex output signal produced by the cascaded gammatone filters in each band. Because the MHA time domain signal representation does not support storing of complex values, real and imaginary parts are stored in different output channels.

Example: If the input has 2 channels (ch0, ch1), and `gtfb_analyzer` splits into 3 bands (b0, b1, b2), then the order of output channels produced by `gtfb_analyzer` is: ch0_b0_real, ch0_b0_imag, ch0_b1_real, ch0_b1_imag, ch0_b2_real, ch0_b2_imag, ch1_b0_real, ch1_b1_imag, ch1_b1_real, ch1_b1_imag, ch1_b2_real, ch1_b2_imag

<code>srate</code>	float	Sampling rate in Hz	(monitor)

8.4 multibandcompressor

Multiband compressor framework based on level in overlapping filter bands.

8.4.1 Detailed description

`multibandcompressor` provides a complete framework for dynamic range compression in multiple frequency bands.

It contains the same filterbank as the `fftfilterbank` plugin (see there for documentation of the filterbank) and combines the frequency bands again after the compression.

For the actual dynamic range compression, `multibandcompressor` can load any other plugin using the field `plugin_name`. Common choices for this plugin would be `dc_simple` or `dc`.

Note that the dynamic range compression receives a pseudo time signal where the sampling rate is the rate of the block processing, i.e. in each channel and band, there is exactly 1 signal sample for every block. These samples are a sparse, non-negative representation of the actual signal in the respective frequency band: The magnitude of each sample is chosen by `multibandcompressor` so that the level computed from this sparse signal is the same as the level computed from the full signal for this frequency band.

The dynamic range compression will then apply gain (or attenuation) to the sparse signal in each frequency band. The gain applied to the sparse signal is measured by `multibandcompressor` and eventually applied to the respective full signal.

Before the compressor gain is applied to the full signal, it may be modified by the after-burner built into the `multibandcompressor` plugin (sub-parser 'burn'): The purpose of the after-burner is to enforce a configurable Maximum Power Output (MPO) for each frequency band, and to compensate for drains and confluxes of sound energy through vents and open fittings. Note that compensating for drains in this way can easily lead to feedback howling and should be done with caution. The after-burner can be disabled by setting `burn.bypass=yes`.

8.4.2 Supported domains

The MHA plugin `multibandcompressor` supports these signal domains:

- spectrum to spectrum

fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

10.2 smoothgains_bridge

Gain smoothing for reduction of filter length

10.2.1 Detailed description

The overlap-add framework allows filter lengths of the zero padding length. Longer filters will result in artifacts caused by circular aliasing. Artifacts can be reduced by either applying Hanning ramps to the zero-padded blocks after filtering, or by shortening the impulse response of the filter, and thus implicitly reducing the frequency resolution. This plugin reduces the filter length to match exactly the zero-padding length. It can either keep the phase (mode=linear_phase), and reduce causal and a-causal parts of the impulse response, or apply a minimum phase filter phase, and cut the causal part of the filter. The window position in the overlap-add framework has to be configured appropriately: For linear phase mode, a symmetric window position is required, i.e., `wnd.pos=0.5`. To allow minimal phase filters, an asymmetric window position (`wnd.pos=0`) is needed. Using minimal phase filters will destroy the phase, but reduces the algorithmic delay.

10.2.2 Supported domains

The MHA plugin `smoothgains_bridge` supports these signal domains:

- spectrum to spectrum

10.2.3 Plugin Tags

level-modification filter data-flow overlap-add

Name	Type	Description	Default
<code>prior_q</code>	<code>float</code>	priorQ for computing GLR and SPP from local SNR Range: [0,2]	0.5
<code>xi_opt_db</code>	<code>float</code>	xiOpt in dB for computing GLR and SPP from local SNR Range: [0,40]	15

13 Plugin category 'plugin-arrangement'

13.1 altplugins

Configure alternative plugins.

13.1.1 Detailed description

The plugin `altplugins` allows configuration of alternative plugins. The plugin used for processing can be selected via the `select` variable at any time. Any plugins can be used as alternative plugins, with the only limitations that input and output domain and signal dimension is equal for all alternative plugins. Plugins can be renamed using the ":" operator.

This plugin is automatically located by the graphical user interface `t mhacontrol` and used for an algorithm selection panel.

13.1.2 Supported domains

The MHA plugin `altplugins` supports these signal domains:

- waveform to waveform
- waveform to spectrum
- spectrum to waveform
- spectrum to spectrum

13.1.3 Plugin Tags

plugin-arrangement data-flow

13.1.4 Configuration variables

Name	Type	Description	Default
mhaconfig_in	parser	Input configuration	(see below)

fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

13.2 analysispath

Split-up of signal analysis and filtering, with asynchronous processing of filter path and thread-safe exchange of filter parameters as AC variables.

13.2.1 Detailed description

In many signal processing scenarios, the signal analysis requires larger block sizes and more processing time than the filtering itself. If the filters do not change rapidly, the filter coefficients can be processed independently from the filter process. This is realized in this plugin: A copy of the input signal is stored in a double buffer, which is then processed asynchronously in a thread with lower priority. At the same time, a snapshot of the AC space (or a subset of it) can be transferred from the analysis thread to the main processing thread.

Figure 7 Schematic signal flow in the analysis path scenario.

Please note that the AC variables which should be copied to the processing thread must exist after the `prepare()` callback and should not change their size during run-time.

13.2.2 Supported domains

The MHA plugin `analysispath` supports these signal domains:

- waveform to waveform

13.2.3 Plugin Tags

[plugin-arrangement algorithm-communication data-flow](#)

13.2.4 Configuration variables

Name	Type	Description	Default

wndlen	int	Window length of spectral data	(monitor)
fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

13.3 mhachain

MHA Chain

13.3.1 Detailed description

Load a sequence of plugins. During processing, the signal is passed from plugin to plugin, and may change its domain or dimension.

If profiling is switched on, the cumulative time spent in the processing callback of each plugin is stored in a monitor variable.

The complete chain can be replaced by other algorithms during run-time if the default configuration is valid for processing and if the output domain or dimension does not change by replacing the chain.

13.3.2 Supported domains

The MHA plugin `mhachain` supports these signal domains:

- waveform to waveform
- waveform to spectrum
- spectrum to waveform
- spectrum to spectrum

13.4 overlapadd

Waveform to spectrum overlap add and FFT method. Audio data is collected up to `wndlen`, than windowed with the given window function, zero padded up to `fftlength` (symmetric zero padding or asymmetric zero padding possible), and Fast-Fourier-transformed. All parameter changes take effect after the next prepare call.

13.4.1 Detailed description

This plugin transforms fragmented waveform data into short time Fourier transformed audio (STFT), and after processing by spectral processing plugins back to the time domain. This overlap-add mechanism is similar to that from Allen (1977): First, the waveform signal is windowed with a window function, e.g., a Hanning window. In each processing frame, the window is shifted by the fragment size of the input waveform. Missing parts of the signal are taken from the past. The windowed signal is padded with zeros on both sides up to the FFT length, to avoid aliasing when filters are applied in the frequency domain. The impulse response of the applied filter can have the length of the zero padding; if the impulse response is longer, later parts of the impulse response will be mapped to the beginning of the fragment (temporal aliasing). Linear phase filters (real gains in the frequency domain) produce symmetric impulse responses and therefore require symmetric zero padding. The zero padded signal is now fast Fourier transformed. Parameters are FFT length N , window length M and the fragment size P . Typical values for the window length are $M = 2P$ or $M = 4P$. The Hanning window used in the first step is $w_1(k) = \frac{1}{2}(1 - \cos(2\pi k/M))$, the windowed signal is

$$x_w(m, k) = w_1(k) \cdot x(m \cdot P + k), \quad (14)$$

with $k = 0, \dots, M - 1$ and the fragment index m .

After processing and inverse Fourier transformation, Hanning ramps are applied to the signal to avoid discontinuities in case of temporal aliasing, and thus reducing the artifacts. The length of the Hanning ramps are a fraction p of half the zero-padding length $(N - M)/2$. If $p = 1$, the entire zero-padded parts are smoothed with Hanning ramps. $p = 0$ means, that no Hanning ramps are applied to the signal. This allows an exact reproduction in those cases, where the local impulse response of the filter (represented by all algorithms between FFT and inverse FFT) is shorter than the zero padding length. The windowing in both stages of the overlap-add mechanism is plotted in Fig. 8 for $M = 2P$ (50% overlap).

The total delay between input and output of a real-time system with fragment size P and an overlap-add based linear-phase filter, is the window length plus half the zero-padding length, or $M + (N - M)/2$, plus an additional delay needed for the signal processing, and plus a delay generated by the AD/DA converters (e.g., anti-aliasing filter delay). In an offline system, the complete input signal is available in advance, and thus the delay of the overlap-add method is determined only by the relative shift between output and input signal, which is $(M + N)/2 - P$ (equal to $N/2$ in case of 50% overlap, i.e. $M = 2P$). Contrary to a real-time system, the delay of an offline system depends on the amount of overlap.

13.4.2 Supported domains

The MHA plugin `overlapadd` supports these signal domains:

- waveform to waveform

13.4.3 Plugin Tags

[plugin-arrangement](#) [signal-transformation](#) [overlap-add](#)

Figure 8 Windowing in the overlap-add method with 50% overlap and zero-padding. In the upper panel, the windowed input signal before applying the FFT is schematically plotted. In the lower panel, the same time interval after inverse FFT is shown. The shaded segment is the fragment which is read from the input stream (upper panel) and written to the output stream (lower panel) in one processing cycle. The delay between input and output signal is the length of leading zeros plus the window length.

Figure 9 Windowing in the overlap-add method, as in Fig. 8, but with post-windowing and without zero-padding. In this setup, W^α is applied before FFT and $W^{1-\alpha}$ is used for post-windowing. The delay between input and output signal is the window length.

13.5 resampling

Synchronous resampling plugin.

13.5.1 Detailed description

A bridge type resampling plugin. The signal is converted to target sampling rate and fragment size. The converted signal is processed by the child plugin. The processed signal is then converted back to the original sampling rate and fragment size. The input data is buffered, and the data is processed when enough samples are available.

Please note that double buffering adds an extra delay of the audio stream. If both fragment sizes are identical, the double buffering is bypassed.

13.5.1.1 Warning:

A synchronous resampling ringbuffer such as this causes varying computational loads in the outer processing buffer. It is therefore not real-time safe.

13.5.2 Supported domains

The MHA plugin `resampling` supports these signal domains:

- waveform to waveform

13.6 split

Split audio signal into channel groups and have them processed by different plugins in parallel

13.6.1 Detailed description

The plugin 'split' takes a multi-channel input signal and splits it up into separate chains of groups of channels. After processing of each chain, the output channels are merged into a multi-channel output signal. The order of the audio channels is left unchanged.

13.6.2 Supported domains

The MHA plugin `split` supports these signal domains:

- waveform to waveform
- waveform to spectrum
- spectrum to waveform
- spectrum to spectrum

15 Plugin category 'signal-transformation'

15.1 downsample

Downsampling by integer fractions

15.1.1 Detailed description

This plugin performs downsampling by an integer factor named `ratio`. The input fragment size needs to be divisible by `ratio`.

As result of the downsampling, the output signal has a lower sampling rate (`srate`) as well as a smaller fragment size (`fragsize`) with respect to the input signal of the `downsample` plugin (both are divided by the downsampling factor `ratio`).

The signal duration (T_{signal}) of the audio blocks processed in each invocation of the `process` callbacks of `openMHAplugins` is

$$T_{signal} = \frac{fragsize}{srate} = \frac{fragsize/ratio}{srate/ratio}$$

and is not changed by the `downsample` plugin. The total number of invocations of the `process` method is not modified for downstream plugins by the downsampling.

The downsampling is performed by copying only every `n`-th audio sample of the low-pass filtered input signal over to the output signal. A low-pass filter is required to reduce aliasing in the output signal and can be configured through the `antialias` configuration setting.

15.1.2 Supported domains

The MHA plugin `downsample` supports these signal domains:

- waveform to waveform

15.1.3 Plugin Tags

signal-transformation filter

B	vector<float>	non-recursive filter coefficients	[1]

15.2 spec2wave

spectrum to waveform iFFT plugin Performs inverse FFT, postwindowing, hanning ramps at zero-padding, overlap-add, normalization. Note that normalization only works for $\text{mod}(\text{wndlen}, \text{fragsize})=0$. Also note that postwindowing only works for $\text{wndpos}=0.5$. Always set $\text{ramplen}=0$ here if $\text{wndpos} \neq 0$ in the corresponding `wave2spec`.

15.2.1 Detailed description

This plugin calculates the inverse FFT and overlap add resynthesis. The parameters are taken from the framework overlap add parameters. After the inverse Fourier transform, hanning window ramps are applied to the previously zero-padded regions.

15.2.2 Supported domains

The MHA plugin `spec2wave` supports these signal domains:

- spectrum to waveform

15.2.3 Plugin Tags

signal-transformation overlap-add

srate	float	Sampling rate in Hz	(monitor)

15.3 upsample

Upsampling by integer fractions

15.3.1 Detailed description

This plugin performs upsampling by an integer factor named `ratio`.

As result of the upsampling, the output signal has a higher sampling rate (`srate`) as well as a larger fragment size (`fragsize`) with respect to the input signal of the `upsample` plugin (both are multiplied by the upsampling factor `ratio`).

The signal duration (T_{signal}) of the audio blocks processed in each invocation of the `process` callbacks of openMHAplugins

$$T_{signal} = \frac{fragsize}{srate} = \frac{fragsize \cdot ratio}{srate \cdot ratio}$$

is not changed by the `upsample` plugin so that the total number of invocations of the `process` method is not modified for downstream plugins by the upsampling.

The upsampling is performed by spreading consecutive input audio samples to only every n -th sample of the output signal while setting the output samples in between consecutive input samples to value 0. A low-pass filter is required to reduce aliasing in the output signal and can be configured through the `antialias` configuration setting.

15.3.2 Supported domains

The MHA plugin `upsample` supports these signal domains:

- waveform to waveform

15.4 wave2spec

Waveform to spectrum overlap add and FFT method.

Audio data is collected up to `wndlen`, then windowed with the given window function, zero padded up to `fftl` (symmetric zero padding or asymmetric zero padding possible), and fast-Fourier-transformed (FFT).

15.4.1 Detailed description

This plugin performs the domain transformation from time-domain waveform signal to short-time Fourier transform (STFT) signal in the spectral domain. This plugin can be used as the analysis part of a complete overlap-add procedure. Audio signal data is collected up to the length of the analysis window. The hop-size is equal to the audio block size that this plugin receives. Window size and FFT length are configurable through the configuration variables of this plugin.

The shape of the analysis window is also configurable: Several pre-defined window shapes can be selected, and also a completely user-defined window shape. In addition, a configurable exponent can be applied to all samples of the window before it is used.

During processing, the input data samples are multiplied with the samples of the analysis window, zero padded to the FFT length and Fourier transformed. Please note that usually the window shift is less than the window length. For this reason, the short time fourier transform does not exactly correspond to the current input waveform block: the analysis window contains samples from the current as well as from previous invocation(s). The absolute window shift is identical to the fragment size, e.g. to achieve a window shift of 50%, configure a fragment size of `wndlen/2`.

A copy of the output spectrum is stored in the AC space in a variable of same name as the configured plugin name. To access the spectrum in AC space from the code of self-developed other plugins, the function `MHA_AC::get_var_spectrum()` can be used. See the open-MHAdeveloper manual or the header file `mha_algo_comm.h` for details.

Please refer to section [13.4](#) for a description of the overlap-add method that is also followed by this plugin, `wave2spec`.

Example configurations for the `wave2spec` plugin are available in the short-time-fourier-transform examples directory, and in the matlab/octave tests exercising this plugin in the `mhatest` directory. These test files are executed together with the other system-level tests when invoking `make test`. Please note that you need to have the signal processing package installed in order to successfully execute all tests for this plugin.⁶

15.4.2 Supported domains

The MHA plugin `wave2spec` supports these signal domains:

- waveform to waveform
- waveform to spectrum

15.4.3 Plugin Tags

[signal-transformation overlap-add](#)

⁶In octave, the package can be installed with `pkg install -forge control signal` from within octave.

16 Plugin category 'spatial'

16.1 adm

Adaptive differential microphone

16.1.1 Detailed description

This plugin implements one or more adaptive first-order differential microphones, each based on the output of two omnidirectional microphones, e.g. two hearing-aid microphones (cf. Elko & Nguyen Pong, 1995). This is achieved by first subtracting the outputs of the two omnidirectional microphones with fixed delays to create a forward-facing and a backward-facing cardioid microphone, respectively; then, in a second step, the signal from the backward-facing cardioid is amplified by a variable gain factor and subtracted from the signal from the forward-facing cardioid. Finally, a lowpass filter and a filter compensating for comb-filter effect is applied to the output signal.

The gain factor, β , is determined adaptively such that the power of the output signal is minimized, under the constraint that the null of the ADM is located in the rear half-plane. The adaptation step size, μ_{β} , can be chosen in order to find the optimal combination of adaptation speed and accuracy.

Figure 10 Output signals illustrating convergence of the ADM algorithm for three different values of μ_{β} (input signal: white Gaussian noise exactly from behind)

16.1.2 Supported domains

The MHA plugin `adm` supports these signal domains:

- waveform to waveform

16.1.3 Plugin Tags

spatial signal-enhancement beamformer adaptive

16.1.4 Configuration variables

Name	Type	Description	Default
mhaconfig_in	parser	Input configuration	(see below)
mhaconfig_out	parser	Output configuration	(see below)
front_channels	vector<int>	Channel indices for front microphones Range: [0,[[0 1]
rear_channels	vector<int>	Channel indices for rear microphones Range: [0,[[2 3]
distances	vector<float>	Distance between front and rear microphones Range: [0.0008,0.08]	[0.0108 0.0108]
lp_order	int	Filter order of FIR lowpass filter Range: [46,128]	46
decomb_order	int	Filter order of FIR comb compensation filter Range: [46,128]	54
bypass	int	If 1, output front microphones directly; if 2, output rear microphones directly Range: [0,2]	0
beta	float	Explicit fixed beta (-1 for adaptive filtering)	-1
mu_beta	vector<float>	Adaptation step size for each set of ADMs (e.g. left and right) Range: [0,]	[0.0001 0.0001]
tau_beta	vector<float>	time constant / s of low pass filter for averaging power of output signal (used for adaptation) Range: [0,]	[0.05 0.05]
coeff_lp	vector<float>	Lowpass coefficients	(monitor)
coeff_decomb	vector<float>	Decomb coefficients	(monitor)

Variables of sub-parser `mhaconfig_in`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftlen	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

Variables of sub-parser `mhaconfig_out`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftlen	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

16.2 coherence

Coherence filter

16.2.1 Supported domains

The MHA plugin `coherence` supports these signal domains:

- spectrum to spectrum

16.2.2 Plugin Tags

spatial signal-enhancement dereverberation adaptive

16.2.3 Configuration variables

Name	Type	Description	Default
mhaconfig_in	parser	Input configuration	(see below)
mhaconfig_out	parser	Output configuration	(see below)
unit	keyword_list	Frequency unit Range: [Hz kHz Oct Oct/3 Bark Erb ERB_Glasberg1990]	Hz
f	vector<float>	Frequencies	[]
f_hz	vector<float>	Frequencies in Hz	(monitor)
fscale	keyword_list	frequency scale of filter bank Range: [linear bark log erb ERB_Glasberg1990]	linear
ovltype	keyword_list	filter overlap type Range: [rect linear hanning exp gauss]	rect
plateau	float	relative plateau width Range: [0,1[0
ftype	keyword_list	frequency entry type Range: [center edge]	center
normalize	bool	normalize broadband output amplitude	no
fail_on_nonmonotonic	bool	Fail if frequency entries are non-monotonic (otherwise sort)	yes
fail_on_unique_bins	bool	Fail if center frequencies share the same FFT bin.	yes
cf	vector<float>	final center frequencies in Hz	(monitor)
ef	vector<float>	final edge frequencies in Hz	(monitor)
cLTASS	vector<float>	Bandwidth level correction for LTASS noise in dB	(monitor)
shapes	matrix<float>	Frequency band shapes	(monitor)
tau_unit	keyword_list	tau unit Range: [seconds periods]	seconds
tau	vector<float>	Averaging time constant Range: [0,]	[0.04]
alpha	vector<float>	Gain exponent Range: [0,]	[1]
limit	float	gain limit / dB (zero: no limit) Range: [,0]	0
mapping	vector<float>	mapping interval of coherence estimator to coherence (min max) Range: [0,1]	[0 1]
average	keyword_list	average mode Range: [ipd spec]	ipd
invert	bool	Invert filter after mapping, before exponent.	no
ltgcomp	bool	Long term gain compensation?	no
ltgtau	vector<float>	Long term gain estimation time constant / s Range: [0,]	[1]
staticgain	vector<float>	Static gain in frequency bands / dB	[0]
delay	int	Delay between analysis and filter (delay of gains), in fragments. Range: [0,]	0

Variables of sub-parser mhaconfig_in:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftlen	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

Variables of sub-parser `mhaconfig_out`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftlen	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

16.3 delaysum

delay and sum plugin. Mixes all channels into a single output channel after applying channel-specific weights and delays.

16.3.1 Detailed description

This plugin allows to delay and sum multiple input channels using individual delays and weights. After each channel is delayed it is multiplied with the given weight and then added to the single output channel.

16.3.2 Supported domains

The MHA plugin `delaysum` supports these signal domains:

- waveform to waveform

16.3.3 Plugin Tags

spatial beamformer

16.3.4 Configuration variables

Name	Type	Description	Default
mhaconfig_in	parser	Input configuration	(see below)
mhaconfig_out	parser	Output configuration	(see below)
weights	vector<float>	weights of channels. Each entry is multiplied to its respective channel. Needs one entry per channel.	[1 1]
delay	vector<int>	delay in number of frames. The nth channel is delayed by the number of frames found in the nth entry. Range: [0,]	[0 0]

Variables of sub-parser `mhaconfig_in`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

Variables of sub-parser `mhaconfig_out`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

16.4 doasvm_classification

Support vector machine (SVM) plugin for computing the direction of arrival (DOA) probabilities

16.4.1 Detailed description

This plugin loads the parameters of a pre-trained SVM and computes the probabilities for given range of directions of arrival (DOA). These probabilities take a value within the interval of [0, 1]. Higher probability for a certain DOA indicates higher possibility of a source coming from that particular DOA.

16.4.2 Supported domains

The MHA plugin `doasvm_classification` supports these signal domains:

- waveform to waveform

16.4.3 Plugin Tags

spatial classifier binaural

16.4.4 Configuration variables

Name	Type	Description	Default
mhaconfig_in	parser	Input configuration	(see below)
mhaconfig_out	parser	Output configuration	(see below)
angles	vector<float>	The angles for which the SVM model has been trained	[]
w	matrix<float>	The separation planes of the model.	[[]]
b	vector<float>	The model bias.	[]
x	vector<float>	The sigmoid probability mapping parameter x.	[]
y	vector<float>	The sigmoid probability mapping parameter y.	[]
p_name	string	The name of the AC variable for the vector of probabilities of the DOA estimation.	p
max_p_ind_name	string	The name of the AC variable for the index of the maximum probability of the DOA estimation	p_max
vGCC_name	string	The name of the AC variable for the GCC matrix, which is computed by another plugin	vGCC_ac

Variables of sub-parser `mhaconfig_in`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftlen	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

Variables of sub-parser `mhaconfig_out`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftlen	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

16.5 doasvm_feature_extraction

Plugin for computing the generalized cross correlation with phase transform (GCC-PHAT)

16.5.1 Detailed description

This plugin computes the generalized cross correlation with phase transform (GCC-PHAT). The input to this plugin is a stereo time domain signal. The GCC-PHAT matrix is saved into the AC space.

16.5.2 Supported domains

The MHA plugin `doasvm_feature_extraction` supports these signal domains:

- waveform to waveform

16.5.3 Plugin Tags

spatial feature-extraction binaural

16.5.4 Configuration variables

Name	Type	Description	Default
<code>mhaconfig_in</code>	parser	Input configuration	(see below)
<code>mhaconfig_out</code>	parser	Output configuration	(see below)
<code>fftlen</code>	int	The length of the FFT window Range: [0,[160
<code>max_lag</code>	int	Maximum lag in samples between microphones (setup-dependent) Range: [0,[20
<code>nupsample</code>	int	The amount the GCC-PHAT spectrum is oversampled Range: [0,[4
<code>vGCC_name</code>	string	The name of the AC variable for saving the GCC matrix in	<code>vGCC_ac</code>

Variables of sub-parser `mhaconfig_in`:

Name	Type	Description	Default
<code>channels</code>	int	Number of audio channels	(monitor)
<code>domain</code>	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
<code>fragsize</code>	int	Fragment size of waveform data	(monitor)
<code>wndlen</code>	int	Window length of spectral data	(monitor)
<code>fftlen</code>	int	FFT length of spectral data	(monitor)
<code>srate</code>	float	Sampling rate in Hz	(monitor)

Variables of sub-parser `mhaconfig_out`:

Name	Type	Description	Default
<code>channels</code>	int	Number of audio channels	(monitor)
<code>domain</code>	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
<code>fragsize</code>	int	Fragment size of waveform data	(monitor)
<code>wndlen</code>	int	Window length of spectral data	(monitor)
<code>fftlen</code>	int	FFT length of spectral data	(monitor)
<code>srate</code>	float	Sampling rate in Hz	(monitor)

17 Plugin category 'test-tool'

17.1 cpuload

cpu load generator. CPU load is proportional to number of channels, number of frames, and factor

17.1.1 Supported domains

The MHA plugin `cpuload` supports these signal domains:

- waveform to waveform
- spectrum to spectrum

17.1.2 Plugin Tags

test-tool

17.1.3 Configuration variables

Name	Type	Description	Default
<code>mhaconfig_in</code>	parser	Input configuration	(see below)
<code>mhaconfig_out</code>	parser	Output configuration	(see below)
<code>factor</code>	float	cpu load factor. Values > 1 increase cpu load, values < 1 decrease it Range: [0,]	1
<code>use_sine</code>	bool	Whether to use the sine function. If not, table interpolation will be used	yes

Variables of sub-parser `mhaconfig_in`:

Name	Type	Description	Default
<code>channels</code>	int	Number of audio channels	(monitor)
<code>domain</code>	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
<code>fragsize</code>	int	Fragment size of waveform data	(monitor)
<code>wndlen</code>	int	Window length of spectral data	(monitor)
<code>fftlen</code>	int	FFT length of spectral data	(monitor)
<code>srate</code>	float	Sampling rate in Hz	(monitor)

Variables of sub-parser `mhaconfig_out`:

Name	Type	Description	Default
<code>channels</code>	int	Number of audio channels	(monitor)
<code>domain</code>	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
<code>fragsize</code>	int	Fragment size of waveform data	(monitor)
<code>wndlen</code>	int	Window length of spectral data	(monitor)
<code>fftlen</code>	int	FFT length of spectral data	(monitor)
<code>srate</code>	float	Sampling rate in Hz	(monitor)

17.2 droptect

Plugin detects dropouts in channels that have a constant spectrum

17.2.1 Supported domains

The MHA plugin `droptect` supports these signal domains:

- spectrum to spectrum

17.2.2 Plugin Tags

test-tool

17.2.3 Configuration variables

Name	Type	Description	Default
<code>mhaconfig_in</code>	parser	Input configuration	(see below)
<code>mhaconfig_out</code>	parser	Output configuration	(see below)
<code>dropouts</code>	<code>vector<int></code>	Number of dropouts detected since last reset or start	(monitor)
<code>consecutive_dropouts</code>	<code>vector<int></code>	Number of consecutive dropouts	(monitor)
<code>blocks</code>	<code>int</code>	Number of blocks processed since last reset or start	(monitor)
<code>reset</code>	<code>bool</code>	Setting to yes clears number of dropouts and blocks	no
<code>threshold</code>	<code>float</code>	Threshold level in dB. All blocks below this threshold are considered to be dropouts	50
<code>tau</code>	<code>float</code>	Time constant for filtering power spectra	0.2
<code>filtered_powspec_mon</code>	<code>matrix<float></code>	Floating average of power spectrum	(monitor)
<code>level_mon</code>	<code>float</code>	current level	(monitor)

Variables of sub-parser `mhaconfig_in`:

Name	Type	Description	Default
<code>channels</code>	<code>int</code>	Number of audio channels	(monitor)
<code>domain</code>	<code>string</code>	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
<code>fragsize</code>	<code>int</code>	Fragment size of waveform data	(monitor)
<code>wndlen</code>	<code>int</code>	Window length of spectral data	(monitor)
<code>fftl</code>	<code>int</code>	FFT length of spectral data	(monitor)
<code>srate</code>	<code>float</code>	Sampling rate in Hz	(monitor)

Variables of sub-parser `mhaconfig_out`:

Name	Type	Description	Default
<code>channels</code>	<code>int</code>	Number of audio channels	(monitor)
<code>domain</code>	<code>string</code>	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
<code>fragsize</code>	<code>int</code>	Fragment size of waveform data	(monitor)
<code>wndlen</code>	<code>int</code>	Window length of spectral data	(monitor)
<code>fftl</code>	<code>int</code>	FFT length of spectral data	(monitor)
<code>srate</code>	<code>float</code>	Sampling rate in Hz	(monitor)

17.3 identity

17.3.1 Detailed description

The simplest openMHA plugin.

This plugin does not modify the signal.

17.3.2 Supported domains

The MHA plugin `identity` supports these signal domains:

- waveform to waveform
- spectrum to spectrum

17.3.3 Plugin Tags

test-tool

17.3.4 Configuration variables

Name	Type	Description	Default
mhaconfig_in	parser	Input configuration	(see below)
mhaconfig_out	parser	Output configuration	(see below)

Variables of sub-parser `mhaconfig_in`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

Variables of sub-parser `mhaconfig_out`:

Name	Type	Description	Default
channels	int	Number of audio channels	(monitor)
domain	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
fragsize	int	Fragment size of waveform data	(monitor)
wndlen	int	Window length of spectral data	(monitor)
fftl	int	FFT length of spectral data	(monitor)
srate	float	Sampling rate in Hz	(monitor)

17.4 testplugin

loads a plugin for testing

17.4.1 Supported domains

The MHA plugin `testplugin` supports these signal domains:

- waveform to waveform
- spectrum to spectrum

17.4.2 Plugin Tags

[test-tool/feature-extraction](#)

17.4.3 Configuration variables

Name	Type	Description	Default
<code>mhaconfig_in</code>	parser	Input configuration	(see below)
<code>mhaconfig_out</code>	parser	Output configuration	(see below)
<code>plugin_name</code>	string	Plugin name	
<code>config_in</code>	parser	signal domain and dimensions	(see below)
<code>config_out</code>	parser	signal domain and dimensions	(see below)
<code>ac</code>	parser	Insert and retrieve AC variables	(see below)
<code>signal</code>	parser	signal input and output	(see below)
<code>prepare</code>	bool	for preparing/releasing the loaded plugin	no

Variables of sub-parser `mhaconfig_in`:

Name	Type	Description	Default
<code>channels</code>	int	Number of audio channels	(monitor)
<code>domain</code>	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
<code>fragsize</code>	int	Fragment size of waveform data	(monitor)
<code>wndlen</code>	int	Window length of spectral data	(monitor)
<code>fftl</code>	int	FFT length of spectral data	(monitor)
<code>srate</code>	float	Sampling rate in Hz	(monitor)

Variables of sub-parser `mhaconfig_out`:

Name	Type	Description	Default
<code>channels</code>	int	Number of audio channels	(monitor)
<code>domain</code>	string	Signal domain (MHA_WAVEFORM or MHA_SPECTRUM)	(monitor)
<code>fragsize</code>	int	Fragment size of waveform data	(monitor)
<code>wndlen</code>	int	Window length of spectral data	(monitor)
<code>fftl</code>	int	FFT length of spectral data	(monitor)
<code>srate</code>	float	Sampling rate in Hz	(monitor)

Variables of sub-parser `config_in`:

Name	Type	Description	Default
channels	int	Number of audio channels Range: [0,]	2
domain	keyword_list	Signal domain Range: [MHA_WAVEFORM MHA_SPECTRUM]	MHA_WAVEFORM
fragsize	int	Fragment size of waveform data Range: [0,]	200
wndlen	int	Window length of spectral data Range: [0,]	400
fftl	int	FFT length of spectral data Range: [0,]	512
srate	float	Sampling rate in Hz Range:]0,]	44100

Variables of sub-parser `config_out`:

Name	Type	Description	Default
channels	int	Number of audio channels Range: [0,]	2
domain	keyword_list	Signal domain Range: [MHA_WAVEFORM MHA_SPECTRUM]	MHA_WAVEFORM
fragsize	int	Fragment size of waveform data Range: [0,]	200
wndlen	int	Window length of spectral data Range: [0,]	400
fftl	int	FFT length of spectral data Range: [0,]	512
srate	float	Sampling rate in Hz Range:]0,]	44100

Variables of sub-parser `ac`:

Name	Type	Description	Default
insert_var	string	Setting this inserts an AC variable into the AC space	
get_var	string	Setting this retrieves an AC variable from the AC space	
data_type	keyword_list	Type of data. No support for MHA_AC_USER and MHA_AC_DOUBLE data access Range: [MHA_AC_CHAR MHA_AC_INT MHA_AC_MHAREAL MHA_AC_FLOAT MHA_AC_DOUBLE MHA_AC_MHACOMPLEX unknown]	unknown
num_entries	int	Number of entries Range: [0,]	1
stride	int	length of one row (C interpretation) or of one column (Fortran interpretation) Range: [0,]	1
char_data	string	data of ac variable if data_type is MHA_AC_CHAR	
int_data	vector<int>	data of ac variable if data_type is MHA_AC_INT	[]
float_data	vector<float>	data of ac variable if data_type is MHA_AC_FLOAT or MHA_AC_MHAREAL	[]
complex_data	vector<complex>	data of ac variable if data_type is MHA_AC_MHACOMPLEX	[]

Variables of sub-parser `signal`:

Name	Type	Description	Default
input_wave	matrix<float>	waveform input signal. Writing data will cause processing	[[]]
input_spec	matrix<complex>	spectrum input signal. Writing data will cause processing	[[]]
output_wave	matrix<float>	waveform output signal from last processing	(monitor)
output_spec	matrix<complex>	spectrum output signal from last processing	(monitor)
